

Problem – Solution Fit Template

Project Design Phase

Project Name	Automated Network Request Management in ServiceNow
Phase	Phase 3: Project Design
Author	Salina Sriraj
Team ID	SALINASRIRAJ-NRM-01
Date	29 June 2026
Platform / Domain	ServiceNow / IT Service Management (ITSM)
Academic Year	2025 – 2026

Problem – Solution Fit Matrix

1. Customer Segment(s)

- Network Requesters: IT Staff, Software Developers, Systems Administrators.
- Approvers: Line Managers, Cybersecurity / IT Security Operations Leads.
- Fulfillment Operators: Network Engineers, System Administrators.
- Oversight: IT Administrators responsible for compliance and reporting.

2. Jobs-to-be-Done / Problems

- Request firewall policy changes, corporate VPN credentials, or VLAN reconfigurations rapidly.
- Ensure all infrastructure modifications undergo valid risk assessment and security vetting before fulfillment.
- Track request lifecycle status transparently without chasing engineers via email or phone.
- Generate compliance-ready audit reports for infrastructure change history.

3. Triggers

- A development team deploys a new service requiring an external port to be opened.
- A vendor or contractor being onboarded needs a secure, isolated corporate VPN profile.
- An upcoming security compliance deadline demands rapid deprecation of stale access rules.
- A network incident requires emergency IP or firewall rule reconfiguration.

4. Before / After Emotional Journey

- Before: Frustrated by bureaucratic delays, anxious about missed deployment timelines, blind to request progression, and overwhelmed by informal multi-channel communication.
- After: Confident in a single submission portal, informed by real-time notifications, reassured by SLA visibility, and satisfied by structured, traceable outcomes.

5. Proposed Solution

- Automated Network Request Management System built on ServiceNow: a structured Service Catalog with 8 network request types, dynamic validated intake forms, multi-stage Flow Designer approval workflows, automated task assignment, SLA tracking with escalation, and comprehensive audit logging — all accessible through the ServiceNow Service Portal.

6. Solution Differentiators

- Uniquely combines client-side regex validation (IP/VLAN/port format enforcement) with risk-based conditional routing within a single ServiceNow PaaS environment — eliminating the need for external ticketing tools, custom code deployments, or middleware integrations.

7. Measurable Outcomes

- Reduction in request MTTR by eliminating manual routing and follow-up cycles.
- Elimination of incomplete request submissions through mandatory field enforcement.
- 100% audit trail coverage for all infrastructure change requests.
- Improved SLA adherence through automated monitoring and escalation.
- Standardized request data enabling meaningful reporting and trend analysis.
